Finding: Insufficient evidence to determine effectiveness

⊠Hospitals, clinics or managed care organizations

Intervention: Smoking cessation series of public service announcements

Potential partners to undertake the intervention:

Nonprofits or local coalitions
Schools or universities
Health care providers
State public health departments
Policymakers

Other:

Background on the intervention:

This intervention recruits and motivates tobacco users to quit during the course of a short-term broadcast cessation series.

Findings from the systematic reviews:

There is insufficient evidence to support the use of smoking cessation series of public service announcements as a means for reducing tobacco use.

Practices that lack sufficient research to support effectiveness should not be confused with ineffective programs. Rather, they should be recognized as programs that have the potential to become evidence-based practices—if properly evaluated. Practitioners are encouraged to monitor the impact of these programs in their communities and report on their findings in order to build a base of knowledge sufficient to reach consensus.
